

0.3 Factoring with an a-value of 1 and GCF Notes

Key Concepts:

_____ is the highest power (exponent) of an equation or function.

A quadratic equation has a _____ of two.

_____ is when a quadratic equation is written in the form $ax^2 + bx + c = 0$.

Factoring when the a-value is 1 Process:

1. Rewrite the equation in standard form.
2. List the factors of the c-value.
3. Choose the two factors that add up to the b-value.
4. Write your linear factors as $(x + r_1)(x + r_2)$.

Example 1: Solve these quadratic equations by factoring

1. $x^2 + 2x - 3$

2. $x^2 - 3x + 2$

3. $x^2 - 7x + 6$
